B. - POTAMOLOGIA E LIMNOLOGIA

ANNOTAZIONI.

La piena e la magra ordinaria sono detratte per ciascuna serie idrometrica basandosi sul criterio di frequenza, ammettendo come ordinarietà dell'evento la frequenza del 75 per cento. Le osservazioni idrometriche e quelle di torbide e temperature delle acque sono effettuate alle ore 12 o ricavate per quell'ora dai diagrammi degli idrometrografi.

Il segno ** indica la massima altezza idrometrica.

id. * id. la minima id. id.

Le temperature dell'aria sono calcolate con la formula di Kämtz: $t_{mia} + K (t_{max} - t_{min})$.

segno (*) indica che mancano le osservazioni.

ANNOTAZIONI.

Le temperature medie sono calcolate con la formula:
$$\frac{t^s + t^{max} + t^{min} + t^{si}}{4}$$

La forza del vento è indicata secondo la scala:

| | | | | | |
|------------|-------------------------------------|-----------------|--|--------------|---------------------------------------|
| 0 - Calma | - Velocità oraria Km. 0-7 | 2 - Moderato | - Velocità oraria Km. 14-29 | 4 - Forte | - Velocità oraria Km. 36-50 |
| 1 - Debole | » » 7-14 | 3 - Quasi forte | » » 29-30 | 5 - Tempesta | » » 50-83 |
| | | 6 - Uragano | - Velocità oraria Km. 83-108 ed oltre. | | |

Le osservazioni pluviometriche, espresse in millimetri, sono effettuate alle ore 9 del mattino e assegnate al giorno stesso. Esse comprendono pioggia e neve fusa. — Le quantità di pioggia segnate in grassetto sono le massime giornaliere.

Nella colonna « strato di neve » viene segnata l'altezza dello strato nevoso sul suolo alla fine del mese.

Il segno (*) indica che mancano le osservazioni.

B. - POTAMOLOGIA E LIMNOLOGIA

ANNOTAZIONI.

La piena e la magra ordinaria sono detratte per ciascuna serie idrometrica basandosi sul criterio di frequenza, ammettendo come ordinarietà dell'evento la frequenza del 75 per cento. Le osservazioni idrometriche e quelle di torbide e temperature delle acque sono effettuate alle ore 12 o ricavate per quell'ora dai diagrammi degli idrometrografi.

Il segno ** indica la massima altezza idrometrica.

id. * id. la minima id. id.

Le temperature dell'aria sono calcolate con la formula di Kämtz: $t_{\min} + K (t_{\max} - t_{\min})$.

segno (*) indica che mancano le osservazioni.

ANNOTAZIONI.

$$t^{\circ} + \frac{t_{\max} + t_{\min} + t^{\circ}}{4}$$

Le temperature medie sono calcolate con la formula:

La forza del vento è indicata secondo la scala:

- 0 - Calma - Velocità oraria Km. 0-7
- 1 - Debole - " " 7-14

- 2 - Moderato - Velocità oraria . . . Km. 14-29
- 3 - Quasi forte - " " 29-30
- 4 - Forte - " - Velocità oraria . . . Km. 36-50
- 5 - Tempesta - " " 50-83
- 6 - Uragano - Velocità oraria . . . Km. 83-108 ed oltre.

Le osservazioni pluviometriche, espresse in millimetri, sono effettuate alle ore 9 del mattino e assegnate al giorno stesso. Esse comprendono pioggia e neve fusa. — Le quantità di pioggia segnate in grassetto sono le massime giornaliere.

Nella colonna « strato di neve » viene segnata l'altezza dello strato nevoso sul suolo alla fine del mese.

Il segno (*) indica che mancano le osservazioni.

B. - POTAMOLOGIA E LIMNOLOGIA

ANNOTAZIONI.

La piena e la magra ordinaria sono detratte per ciascuna serie idrometrica basandosi sul criterio di frequenza, ammettendo come ordinarietà dell'evento la frequenza del 75 per cento. Le osservazioni idrometriche e quelle di torbide e temperature delle acque sono effettuate alle ore 12 o ricavate per quell'ora dai diagrammi degli idrometrografi.

Il segno ** indica la massima altezza idrometrica.

id. # id. la minima id. id.

Le temperature dell'aria sono calcolate con la formula di Kämtz: $t_{\text{min}} + K (t_{\text{max}} - t_{\text{min}})$.

segno (*) indica che mancano le osservazioni.
