

b) POTAMOLOGIA

SEGNi CONVENZIONALI.

* Mancano le osservazioni.

[] Dato interpolato.

? Dato incerto.

ANNOIAZIONI.

I valori di piena e di magra ordinaria sono calcolati, per ciascuna serie idrometrica, dalla data di inizio delle osservazioni a tutto l'anno 1930, basandosi sul criterio di frequenza, ed ammettendo come ordinarietà dell'evento la frequenza del 75 per cento. I valori stessi sono aggiornati al termine di ogni quinquennio.

Le osservazioni idrometriche e quelle di torbida e temperatura delle acque sono effettuate alle ore 12 o ricavate per quell'ora dai diagrammi degli idrometrografi.

Il segno ** indica la massima altezza idrometrica.

id. * id. minima id. id.

Le temperature diurne dell'aria sono date come media delle temperature massima e minima del giorno.

Le medie di riferimento indicate come aventi per origine l'anno 1901 sono tali per le osservazioni idrometriche iniziate in quell'anno o anteriormente: in tutti gli altri casi si riferiscono al periodo che ha origine con l'anno indicato nella testata per l'inizio delle osservazioni.

Le altezze idrometriche interpolate in carattere minuto fra quelle giornaliere rappresentano le altezze di colmo verificatesi da un mezzogiorno all'altro.

L'Ufficio (Sezione di Parma) raccoglie e conserva anche i dati inerenti agli idrometri di cui all'elenco riportato nella pagina seguente:

Per la misura della torbida si usa generalmente la bottiglia Giandotti (litri 2) prelevando ogni giorno alle ore 12 un campione negli affluenti e tre campioni nel Po. Il valore della torbida specifica in ogni stazione viene ricavato per il Po a seguito di filtrazione in luogo e successivo peso dei campioni giornalieri nel laboratorio d'Ufficio, ed è espresso in unità di peso; per gli affluenti, il valore stesso viene ricavato a seguito di decantazione in luogo, ed è espresso in unità di volume.

(-) Massima piena assoluta 6.74 (Ottobre 1857).

Aprile 1932

(.) L'idrometro di Revere sostituisce quello di Ortigia, ora abbandonato, senza sensibili variazioni trovandosi all'opposta sponda quasi nella stessa Sezione e con quota dello zero di pochi centimetri inferiore.

Aprile 1932

2

[illegible]

(*) Massima magra assoluta -1,04 (Agosto 1864). — (**) Massima piena assoluta 5,41 (Ottobre 1857).

Ottobre 1932

(.) L'idrometro di Revere sostituisce quello di Ostiglia, ora abbandonato, senza sensibili variazioni trovandosi sull'opposta sponda quasi nella stessa Sezione e con quota dello zero di pochi centimetri inferiore.

Ottobre 1932

OSSERVAZIONI E RILIEVI NEL DELTA PADANO

IDROMETRIA. — Gli elementi di osservazione sono dedotti dai diagrammi degli idrometri col criterio di indicare i vertici di alta e bassa marea quando questa si manifesta in modo sensibile, e negli altri casi i punti caratteristici del diagramma. Le altezze sono riferite per ogni stazione allo zero idrometrico, la cui quota sul livello medio del mare è indicata sotto il nome della stazione. I tempi sono segnati per ore intere e mezz'ora.

Altezze idrometriche giornaliere

[illegible]

c) GEOIDROLOGIA

SEGNi CONVENZIONALI.

- » Mancano le osservazioni.
- [] Dato interpolato.
- ? Dato incerto.

ANNOZIONI.

Le osservazioni ai pozzi vengono eseguite nove volte al mese nei giorni 2, 5, 8, 12, 15, 18, 22, 25, 28 ed al mattino prima che vengano effettuati forti attingimenti d'acqua.

I valori delle altezze del livello freatico riportati nelle Tabelle che seguono sono riferiti al livello medio del mare.

GENNAIO 1932
